# Evolution Of E-banking Attacks

# Attacks Against Individual Users

## Goal: Identity Theft

### Methods

Phishing, Fake security alerts

XSS, CSRF

Malware (man in the browser,  
extraction of certs and private keys)

### Problems

User awareness

2-factor authentication

OOB transaction confirmations

Additional passwords/PINs

“Known good” target accounts

# Attacks Against Corporate Users

## Goal: Identity Theft

### Methods & Problems

Same as with individual users

### Advantages

More money

Large transactions not unusual

Targets can be found in public certificate directories

# LDAP Explorer – Online Bank Robber's Google

The screenshot shows the LDAP Explorer application window. The title bar reads "ldap://ldap.a-cert.at:389/c=at??base?(objectClass=\*)". The interface includes a menu bar (File, Edit, View, Tools, Help), a toolbar with navigation and search icons, and a search filter "(objectClass=\*)".

The left pane displays a tree view of the LDAP directory structure under "Browser root". The entry "ldap.a-cert.at" is selected and highlighted in blue.

The right pane displays a table of LDAP entry details:

Name	Value
o	A-CERT
c	at
objectClass	country
structuralObjectClass	country
entryUUID	bbfee4a6-c19b-102f-9e31-e78b74d7e90b
creatorsName	cn=hans,c=AT
createTimestamp	20110131153719Z
entryCSN	20111110112504.081916Z#000000#000#000000
modifiersName	cn=hans,c=AT
modifyTimestamp	20111110112504Z
entryDN	c=AT
subschemaSubentry	cn=Subschema
hasSubordinates	TRUE

The status bar at the bottom indicates "Ready. For Help, press F1", "Anonymous" user, and "Schema loaded".

# Attacks Against Online Banking Servers

Online  
Banking  
Server

## Goal: Exploiting Application Flaws

### Methods

Hacking

### Problems

Getting noticed while looking for flaws

### Advantages

Unlimited amount of money

No user interaction (social engineering)

Possible creation of new money

# Direct Resource Access

## Direct Resource Access – URL Cleartext ID

<https://bank/balance?uid=7728356>  
(my account balance data)

<https://bank/balance?uid=7728355>  
(another user's account balance data)

## Direct Resource Access – URL Base64 encoding

<https://bank/balance?dWlkPTc3MjgzNTY=>  
(my account balance data)

Base64decode("dWlkPTc3MjgzNTY=")

"uid=7728356"

Base64encode("uid=772835**5**")

<https://bank/balance?dWlkPTc3MjgzNTU=>  
(another user's account balance data)

## Direct Resource Access – URL Encryption

/balance?Ko7hIGJJ2GqfhSZ9... (Base64)

/balance?AF86B301008AEF5... (Hex)

```
params = "uid=7728356"  
params += "&salt=nobodywillguessthis"  
params += "&rand=" + random()  
enc_params = AES_encrypt(params, key)  
path = "/balance?" + base64(enc_params)
```

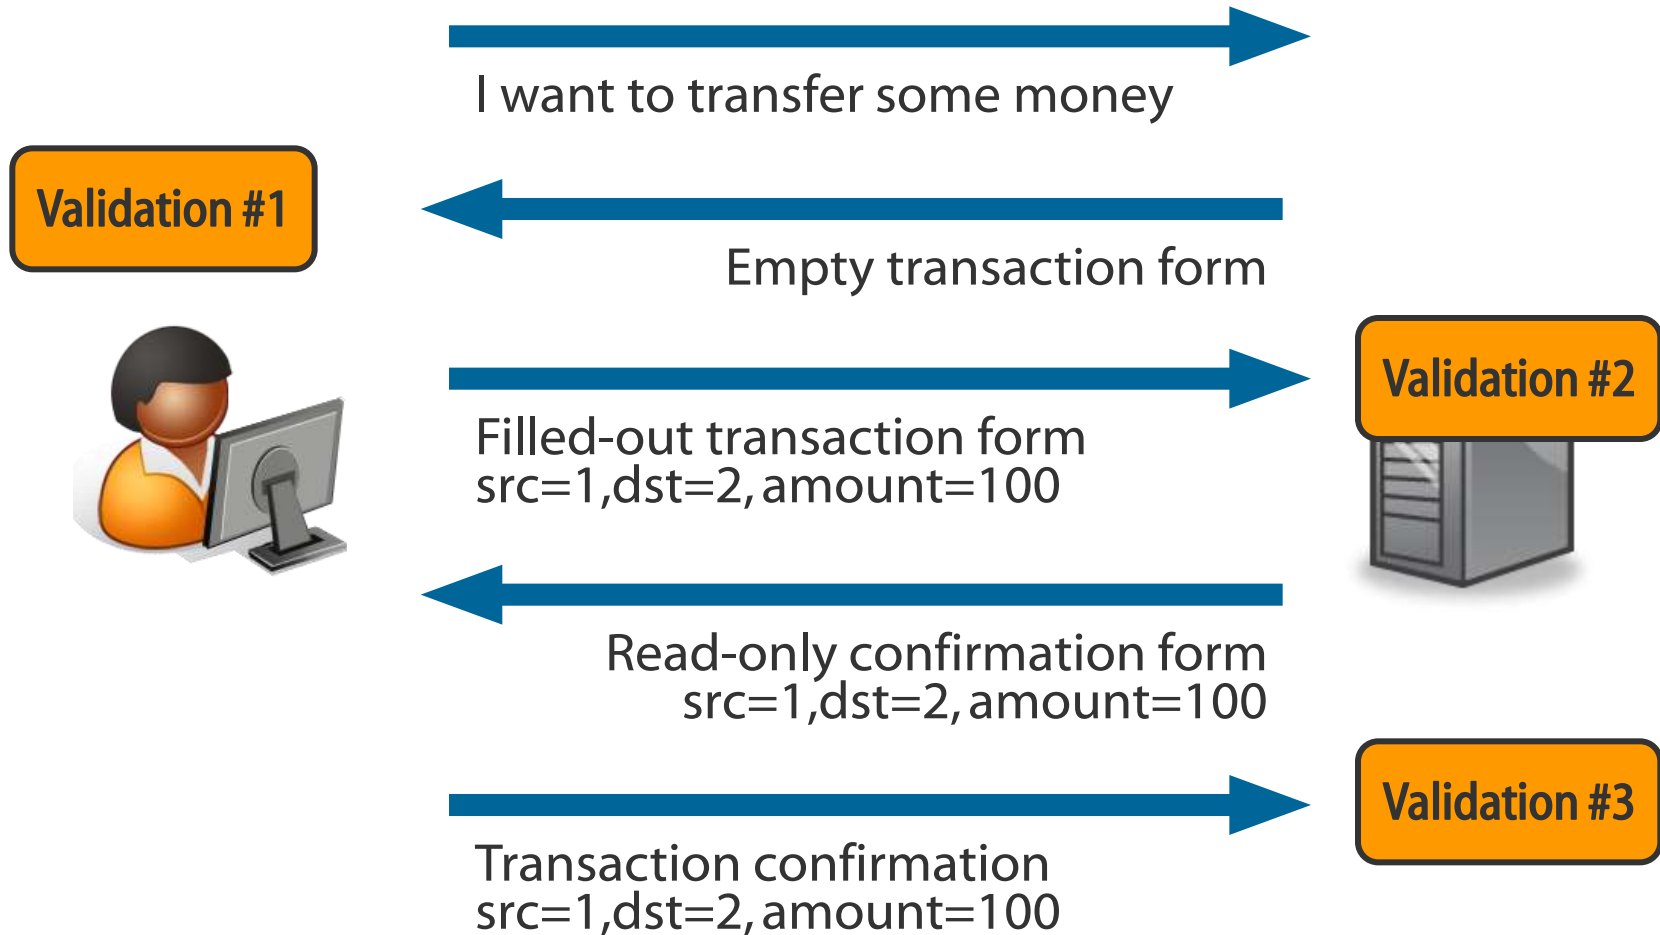

## Transferring Money From Other People's Accounts

`/transfer? src=1 & dest=2 & amount=100`  
(from my account)

`/transfer? src=42 & dest=2 & amount=100`  
(from another user's account)

# Transaction Creation Process

# Negative Numbers

## Negative Numbers – A Devastating Oversight

```
IF RequestedAmount > DisposableAmount  
THEN ERROR();
```

```
IF 3.000 > 2.000  
THEN ERROR(); // Error – Insufficient Funds
```

```
IF -100 > 2.000  
THEN ERROR(); // No Error Here
```

# HTTP Parameter Pollution

Luca Caretoni & Stefano di Paola

<http://www.slideshare.net/Wisec/http-parameter-pollution-a-new-category-of-web-attacks>

## User – Public Server – Back End Server

**POST /transfer**  
**source=1 & dest=2 & amount=100**

JSP

```
source = request.getParameter("source") // 1
amount = request.getParameter("amount") // 100
IF NOT user_authorized_for(source) THEN ERROR()
IF disposable(source) < amount THEN ERROR()
Call BackEndTransaction(request)
```

**POST /BackEndTransaction**  
**source=1 & dest=2 & amount=100**

PHP

```
source = $_POST["source"] // 1
dest = $_POST["dest"] // 2
amount = $_POST["amount"] // 100
```

## HTTP Parameter Pollution – Source account

POST /transfer

source=1 & dest=2 & amount=100 & source=42

JSP

```
source = request.getParameter("source") // 1
amount = request.getParameter("amount") // 100
IF NOT user_authorized_for(source) THEN ERROR()
IF disposable(source) < amount THEN ERROR()
Call BackEndTransaction(request)
```

POST /BackEndTransaction

source=1 & dest=2 & amount=100 & source=42

PHP

```
source = $_POST["source"] // 42
dest = $_POST["dest"] // 2
amount = $_POST["amount"] // 100
IF NOT user_authorized_for(source) THEN ERROR()
```

## HTTP Parameter Pollution – Transfer Amount

POST /transfer

source=1 & dest=2 & amount=100 & amount=100000

JSP

```
source = request.getParameter("source") // 1
amount = request.getParameter("amount") // 100
IF NOT user_authorized_for(source) THEN ERROR()
IF disposable(source) < amount THEN ERROR()
Call BackEndTransaction(request)
```

POST /BackEndTransaction

source=1 & dest=2 & amount=100 & amount=100000

PHP

```
source = $_POST["source"] // 1
dest = $_POST["dest"] // 2
amount = $_POST["amount"] // 100000
IF NOT user_authorized_for(source) THEN ERROR()
```

# SQL Injection

## SQL Injection – Data Theft

```
“SELECT rate FROM exch_rates  
WHERE currency = “$.currency.””
```

```
“SELECT rate FROM exch_rates  
WHERE currency = “UNION  
SELECT balance FROM accounts  
WHERE account_id = ‘887296’”
```

## SQL Injection – Messing With Transactions

“BEGIN TRANSACTION”

“UPDATE accounts SET balance = 0  
WHERE account\_id = “.\$acctid1.””

“UPDATE accounts SET balance = 100  
WHERE account\_id = “.\$acctid2.””

“COMMIT TRANSACTION”

## SQL Injection – Messing With Transactions

“BEGIN TRANSACTION”

“UPDATE accounts SET balance = 0  
WHERE account\_id = '123'”

“UPDATE accounts SET balance = 100  
WHERE account\_id = '456'”

“COMMIT TRANSACTION”

## SQL Injection – Messing With Transactions

“BEGIN TRANSACTION”

“UPDATE accounts SET balance = 0  
WHERE account\_id = '123'”

“UPDATE accounts SET balance = 100  
WHERE account\_id = '456' OR  
account\_id = '123'”

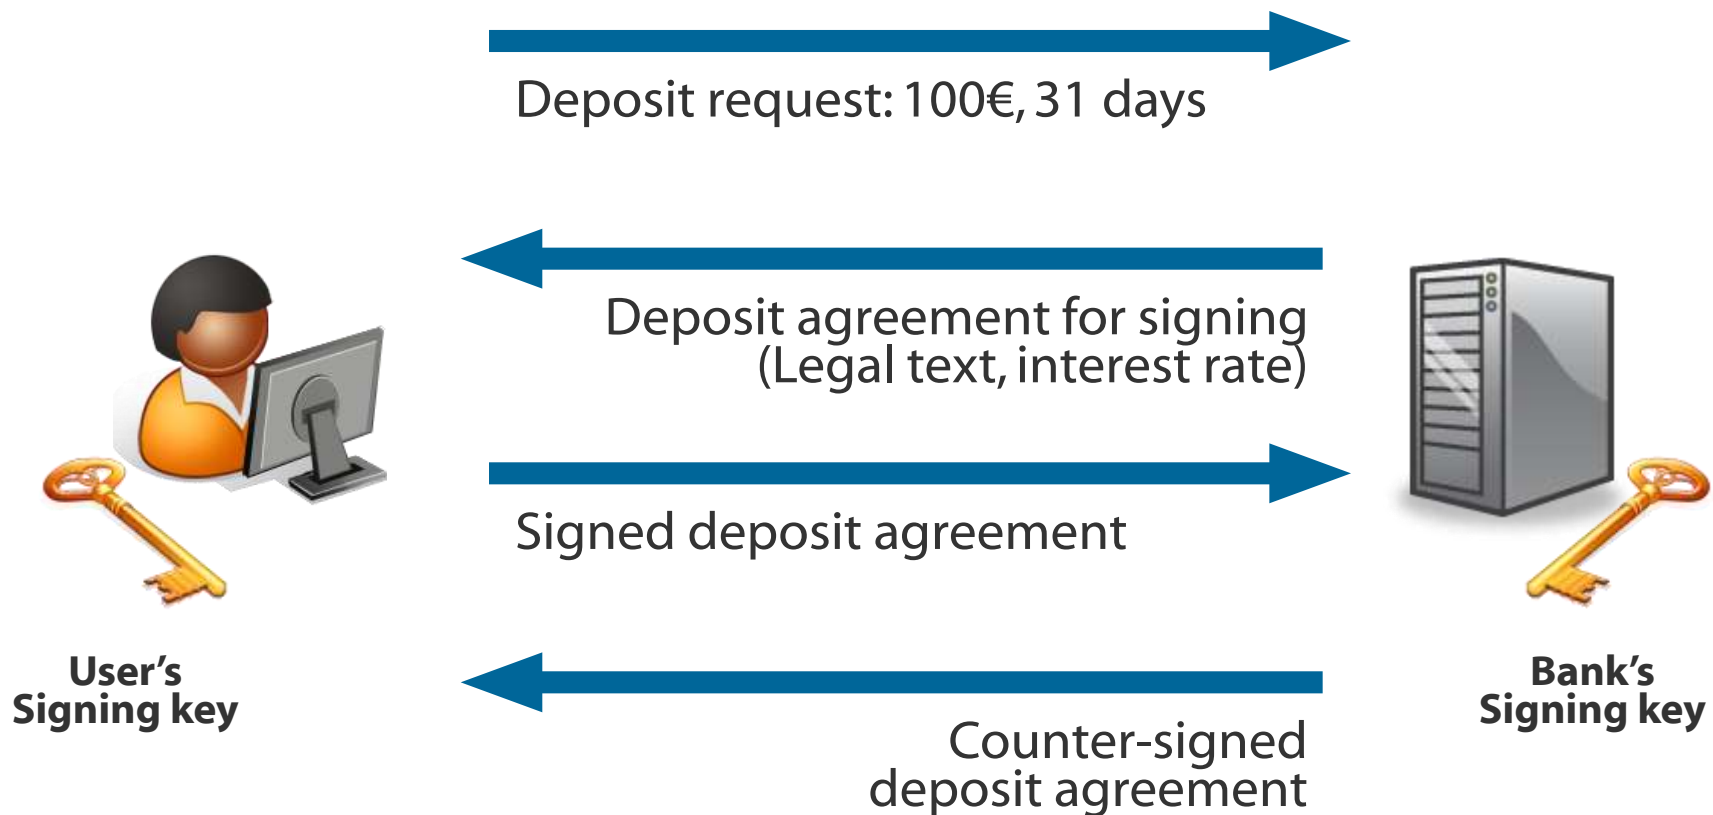

“COMMIT TRANSACTION”

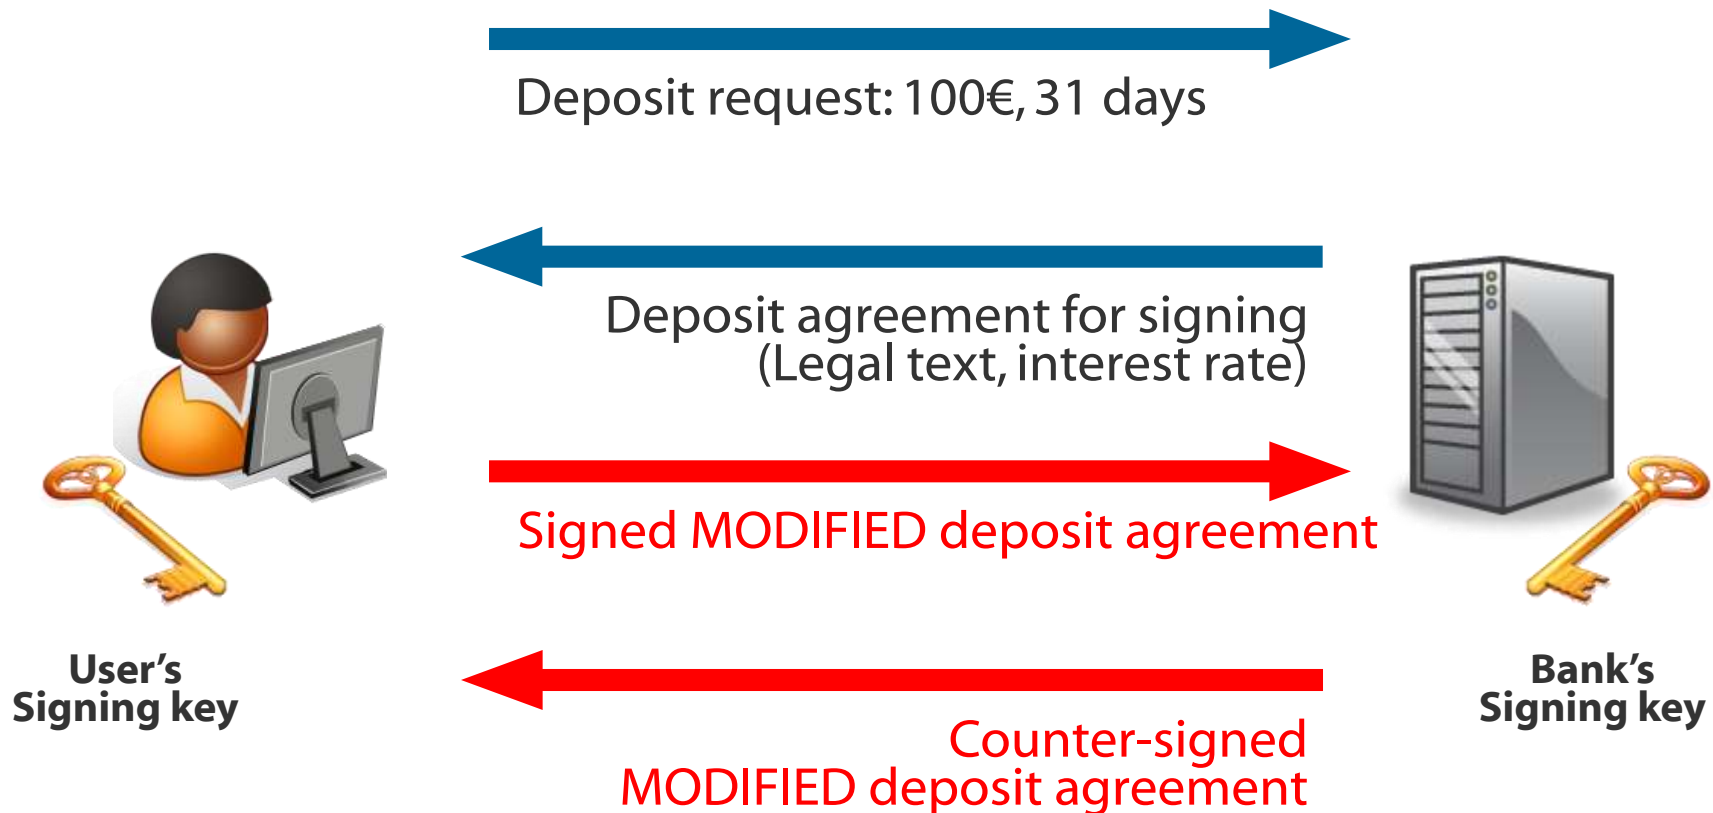

# Forging Bank's Digital Signatures

# Automated Signing Of Deposit Agreement

# Automated Signing Of Deposit Agreement

# Server-Side Code Execution

# Server-Side Code Execution

## Examples

Java code injection (JBoss bug in 2010)

PHP code injection (eval, system, includes...)

Shell argument injection (command1&command2)

Buffer overflows

## Impact

Change e-banking application code

Obtain database/WS credentials,

issue direct requests to DB or back-end WS

**Abstract.** The euro was introduced on the first of January 1999 as a common currency in fourteen European nations. EC regulations are fundamentally different in countries from usual banking practices for they forbid fees when converting national currencies to euros (fees would otherwise deter users from adopting the euro); this creates a unique fraud context where money can be made by taking advantage of the EC's official rounding rules. This paper proposes a public-key-based protection against such attacks. In our scheme, the parties conducting a transaction can not predict whether the rounding will cause loss or gain while the expected statistical difference between an amount and its euro-equivalent decreases exponentially as the number of transactions increases.

## 1 Introduction

Economic and Monetary Union (in short EMU) is a further step in the ongoing process of European integration. EMU will create an area whose economic potential will sustain comparison to that of the United States. Given the euro area, the euro is expected to play an important role as an international currency. As a trade invoicing currency, the euro will also be beyond direct trade relations. Issues related to euro conversion were the general framework of the European conversion rules for currencies and issued [1]. The conversion process was also prepared to provide financial institutions with different formulae. Although great deal of attention was given to producing conversion fees (a political requirement) opens

Assymetric Currency Rounding  
 by M'Raihi, Naccache and Tunstall

<http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.91.8055&rep=rep1&type=pdf>

... was also prepared to provide financial institutions with different formulae. Although great deal of attention was given to producing conversion fees (a political requirement) opens

## Currency Rounding Attack: Algorithm

- 1: Convert 100€ to \$  
// We have 136,40\$
- 2: for i = 1 to 13640  
    Convert 0,01\$ to 0,01€  
    // Now we have 136,40€
- 3: goto 1

# Currency Rounding Attacks

## The Speed Of Getting Rich

Assume: 10 exchanges / second

1 day = 86.400 seconds

Daily profit: 2.300 €

Monthly profit: ~ 70.000 €

## Improvements

Optimal exchange rate (getting as close to 0,005 as possible)

Corporate banking: packets (1000s of exchanges in one packet)

## Does it really work?

My personal e-banking: **YES**

My company's corporate e-banking: **YES**

## Countermeasure

Limit minimum amount to 1 whole unit

# Getting Away With It

# Getting Away With It

## Avoiding Detection

While searching for vulnerabilities

While performing the attack

Solution: *"User in the middle"* – hiding behind a user

## Breaking The Money Trail

Money Mules, Western Union

BitCoin, WebMoney, Liberty Reserve, ...

Chaining multiple *"users in the middle"* in different countries

## Perfect Crime: Print New Money, Don't Let Anyone Know

If nobody loses, nobody knows

DBA attack on back-end database, create fake transaction history

# Attacker's Best Friends

**“This would not work on our system.”**

**“Our back-end validation would not allow this”**

**“Our employees would quickly notice this attack”**

**“This would not work with large sums of money”**

**“SQL injection is not possible because...”**

**New functionalities: automated deposits, loans, investment portfolio management, ...**
